

Project Setup and Configuration

Project setup and configuration is the process of preparing the development environment, installing dependencies, organizing the project structure, and defining application settings required for successful development and deployment.

1. Environment Setup

Prerequisites: OS, Git, Node.js/Java/Python/.NET SDK, Database Server, IDE.

2. Project Initialization

Create project folder, initialize Git repository and package manager.

3. Install Dependencies

Install production and development dependencies.

4. Project Structure

Organize source, configuration, tests, public assets, docs, and root files.

5. Configuration Management

Use .env files and environment variables.

6. Database Configuration

Configure database connection settings.

7. Application Configuration Flow

Load env variables → Initialize DB → Load services → Register routes → Start server.

8. Build and Run

Run in development and production modes.

9. Security Configuration

HTTPS, secrets management, validation, CORS, encryption.

10. Best Practices

Version control, separate environments, automation, documentation.
